## **Project Approach**

The objective of this project was to design two interactive Power BI dashboards that analyze credit card customer demographics and transaction behavior. The approach followed a structured analytics workflow:

### **1. Data Loading & Preparation**

- Customer and Transaction datasets were imported into Power BI and cleaned using Power Query. Data types were validated, missing values were reviewed, and categorical fields were standardized for consistency.

### **2. Data Modeling**

- A relational data model was created using Client Num as the primary key, enabling seamless interaction between customer demographics and transaction metrics.

### **3. DAX Calculations**

- Age Group
- Income Group (Low, Medium, High)
- Total Revenue
- Weekly revenue metrics (current week, previous week)

### **4. Dashboard Development**

- Two dashboards were designed with a focus on clarity, usability, and business relevance. Slicers, drill-throughs, and dynamic filters were implemented to enhance interactivity.

## **Dashboard Summary & Key Insights**

### **Dashboard 1 – Credit Card Customer Report**

- Provides insights into customer demographics by gender, age group, and income group
- Highlights customer distribution, average income, and satisfaction scores
- Enables quick segmentation to understand high-value customer profiles

### **Dashboard 2 – Credit Card Transaction Report**

- Analyzes weekly transaction trends, spending patterns, and transaction frequency
- Identifies top spending categories and revenue contribution by gender
- Supports week-level analysis to track performance over time

## **Interactivity Features**

The final dashboards are fully interactive and allow users to:

- Filter data by Gender (Male/Female)
- Analyze customers by Age Group
- Segment customers by Income Group
- Filter transactions by Week
- Explore Spending Categories dynamically

All visuals update automatically based on selected filters, enabling easy and intuitive data exploration.

## **Challenges Faced**

- Creating accurate weekly revenue calculations using DAX
